# Disclaimer

**Tim Production** audits and reports should not be considered as a form of project's "advertisement" and does not cover any interaction and assessment from "project's contract" to "external contracts" such as Pancakeswap or similar.

**Tim Production** does not provide any warranty on its released reports.

**Tim Production** should not be used as a decision to invest into an audited project and is not affiliated nor partners to its audited contract projects.

**Tim Production** provides transparent report to all its "clients" and to its "clients participants" and will not claim any guarantee of bug-free code within its **SMART CONTRACT**.

**Tim Production** presence is to analyze, audit and assess the client's smart contract's code.

Each company or projects should be liable to its security flaws and functionalities.

## Scope of Work

**FPX** team agreed and provided us with the files that needs to be tested (Github, Bscscan, Etherscan, files, etc.). The scope of the audit is the main contract.

The goal of this engagement was to identify if there is a possibility of security flaws in the implementation of the contract or system.

**Tim Production** will be focusing on contract issues and functionalities

along

with the projects claims from smart contract to their website, whitepaper <sup>3</sup> and repository which has been provided by **FPX**.

# Description

**FPX** designs products, virtual and real, using Blockchain and Web 3.0 technology in order to bring a unique innovation to online payment systems worldwide.

The aim of our project; It is to transform the crypto assets in the existing stock market accounts of the users into coins that can be used in daily life in seconds with the highly secure FPX Mobile App. FPX Token, with the infrastructure it is developing; It is a technology that contributes to the formation of a structure that is valid in all parts of the world and in all areas of the world and that can be easily used by everyone, under its leadership.

# Risk Level Classification

Risk Level represents the classification or the probability that a certain function or threat that can exploit vulnerability and have an impact within the system or contract.

Risk Level is computed based on CVSS Version 3.0

Level	Value	Vulnerability
Critical	9 - 10	An Exposure that can affect the contract functions in several events that can risk and disrupt the contract
High	7 - 8.9	An Exposure that can affect the outcome when using the contract that can serve as an opening in manipulating the contract in an unwanted manner
Medium	4 - 6.9	An opening that could affect the outcome in executing the contract in a specific situation
Low	0.1 - 3.9	An opening but doesn't have an impact on the functionality of the contract
Informational	0	An opening that consists of information's but will not risk or affect the contract

# Auditing Approach

Every line of code along with its functionalities will undergo manual review to check its security issues, quality, and contract scope of inheritance. The manual review will be done by our team that will document any issues that there were discovered.

## Methodology

The auditing process follows a routine series of steps:

### 1. Code review that includes the following:

- Review of the specifications, sources, and instructions provided to Tim Production to make sure we understand the size, scope, and functionality of the smart contract.
- Manual review of code, our team will have a process of reading the code line-by-line with the intention of identifying potential vulnerabilities and security flaws.

### 2. Testing and automated analysis that includes:

- Testing the smart contract functions with common test cases and scenarios, to ensure that it returns the expected results.

3. Best practices review, the team will review the contract with the aim to improve efficiency, effectiveness, clarifications, maintainability, security, and control within the smart contract.

4. Recommendations to help the project take steps to secure the smart contract.

# Used Code from other Frameworks/Smart Contracts (Direct Imports)

## Imported Packages

- Context
- Ownable
- SafeMath
- ReentrancyGuard
- IBEP2E
- IPancakeSwapV2Factor
- y IPancakeSwapV2Pair
- IPancakeSwapRouter01
- IPancakeSwapRouter02
- FPX

# Description

Optimization enabled: Yes

Decimal: 18

Symbol: FPX

Max / Total supply: 1,000,000,000

## Capabilities

### Components

Version	Contracts	Libraries	Interfaces	Abstract	
1.0	1	1	5	3	

### Exposed Functions

Version	Public	Private	External	Internal	
1.0	24	12	75	23	

### State Variables

Version	Total	Public	
1.0	40	7	

### Capabilities

Version	Solidity	Experimental	Can	Uses	Has		
	Observed	Funds	Contracts	Versions	Features	Receive	Assembly Destroyable
1.0	v0.8.4	Yes	Yes	No			

# Correct implementation of Token Standard

Tested	Verified
✓	✓

## Overall Checkup (Smart Contract Security)

Tested	Verified
✓	✓

Function	Description	Exist	Tested	Verified
TotalSupply	Information about the total coin or token supply	✓	✓	✓
BalanceOf	Details on the account balance from a specified address	✓	✓	✓
Transfer	An action that transfers a specified amount of coin or token to a specified address	✓	✓	✓
TransferFrom	An action that transfers a specified amount of coin or token from a specified address	✓	✓	✓
Approve	Provides permission to withdraw specified number of coin or token from a specified address	✓	✓	✓

# Verify Claims

Statement	Exist	Tested	Deployer

# AUDIT PASSED

## Low Issues

A floating pragma is set (SWC-103)	L: 7, L: 33, L: 109, L: 338, L:
State variable visibility is not set (SWC-108)	402 L: 738 C: 7
Usage of equality comparison instead of assignment (SWC-135)	L: 996 C: 4

# Audit Comments

- Deployer can renounce ownership
- Deployer can transfer ownership
- Deployer can burn tokens from user address
- Deployer can pause/unpause contract
- Deployer can create liquidity pool pair
- Deployer can set router address
- Deployer can set liquidity fee with an amount not equal to zero
- Deployer can set liquidity pool buy fee with an amount not equal to zero
- Deployer can set liquidity pool sell fee with an amount not equal to zero
- Deployer can enable swap and liquify
- Deployer can remove liquidity
- Deployer can include/exclude addresses from rewards
- Deployer can take tokens from contract
- Deployer cannot block user
- Deployer cannot mint after initial deployment
